

You are developing a **C# console application** for **StreamBuzz**, a digital content platform that tracks creators' engagement over a period of **4 weeks**. Each creator's name and weekly like counts are recorded using the **CreatorStats** class.

Functionalities:

In class **CreatorStats**, implement the below-given **public** properties.

Datatype	Properties
string	CreatorName
double[]	WeeklyLikes

public static List<CreatorStats> EngagementBoard - In the code template, it is already provided.

In the class **Program**, implement the below-given methods.

Method	Description
public void RegisterCreator(CreatorStats record)	This method is used to register creator record into the EngagementBoard property.
public Dictionary<string, int> GetTopPostCounts(List<CreatorStats> records, double likeThreshold)	This method counts the number of weeks in which each creator's WeeklyLikes that are greater than or equal to the given likeThreshold. If a creator's WeeklyLikes are greater than or equal to the given likeThreshold in each of the weeks, the method should return a dictionary where the creator's name is the key, and the value is the number of weeks in which the creator's WeeklyLikes were greater than or equal to the given likeThreshold. If no creator's WeeklyLikes meets the threshold even once, the method should return an empty dictionary.
public double CalculateAverageLikes()	This method calculates and returns the average of

	all WeeklyLikes count from all the creators in the list.
--	---

In **Program** class, **Main** method,

1. Get the values from the **user**.
2. **Call** the **methods** accordingly and **display** the **result**.
3. When choice **1** is selected, the **user** should be prompted to **input** the **CreatorName** along with **WeeklyLikes** values for **four** weeks and print the message "**Creator registered successfully**".
4. When choice **2** is selected, the **user** should be prompted to **input** the **likeThreshold** , call the **GetTopPostCounts** method, and print the creators' names with their **WeeklyLikes** count as per the sample output. If the method returns an empty dictionary, display "**No top-performing posts this week**".
5. When choice **3** is selected print the message "**Overall average weekly likes: <average>**".
6. When choice **4**, display "**Logging off — Keep Creating with StreamBuzz!**" and **terminate** the **program**.
7. In the **Sample Input / Output** provided, the highlighted text in bold corresponds to the input given by the user, and the remaining text represents the output.

Note:

- Keep the method and class as **public**.
- Please read the method **rules** clearly.
- Do not use Environment.Exit() to terminate the **program**.
- Do not change the given **code** template.

Sample Input/Output :

1. Register Creator
2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

1

Enter Creator Name:

Nicky

Enter weekly likes (Week 1 to 4):

1500

1600

1800

2000

Creator registered successfully

1. Register Creator
2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

1

Enter Creator Name:

Roma

Enter weekly likes (Week 1 to 4):

800

1000

1300

1400

Creator registered successfully

1. Register Creator

2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

2

Enter like threshold:

1400

Nicky - 4

Roma - 1

1. Register Creator
2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

2

Enter like threshold:

5000

No top-performing posts this week

1. Register Creator
2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

3

Overall average weekly likes: 1425

1. Register Creator
2. Show Top Posts
3. Calculate Average Likes
4. Exit

Enter your choice:

4

Logging off - Keep Creating with StreamBuzz!
